Classroom Rules

- You manage the pace. If you feel I am going too fast, please don't hesitate to point it out.
- This workshop will involve tons of live-coding, I will make mistakes. Feel free to (respectfully) point them out.
- A sense of spontaneity! During the last 45 minutes to hour of the workshop, I will take recommendations from the audience about features to add to the app and we will add them together.
- All the rules within the Codemash Code of Conduct apply within this space.
- The learning continues beyond this space! Feel free to reach out to me on Twitter (@captainsafia) or via email (safia@safia.rocks) with questions.

What is Meteor.js?

- Web framework for developing reactive single-page web applications
- First introduced in 2011 under the name Skybreak
- Integrates heavily with MongoDB
- Data changes are automatically propagated to the client without you having to code the synchronization process

The Seven Principles of Meteor

Data on the Wire

One Language to Rule
Them All

Database Everywhere

Latency Compensation

Full Stack Reactivity

Embrace the
Ecosystem

Simplicity Equals
Productivity

PROGRAMMING

Less talk, more code!
